13. ABSTRACT <i>(Maximum 200 words)</i>  <p>The Program for Critical Technologies in Breast Oncology is involved in several interrelated areas of support for research on breast cancer: 1) centralized collection and evaluation of human breast tissues; 2) establishment of a comprehensive database; 3) distribution of tissue samples; 4) molecular characterization of tissues; and 5) examination of ethical questions relating to tissue use. Human tissue samples are essential to progress in research on breast cancer. A shared resource facility can best cope with the demands of proper collection and storage of human tissue for a variety of research uses, without interfering with the pathologist's diagnosis. Because of advances in early detection of breast cancer, the size of tumors is getting smaller. This situation demands that efficient use be made of tissues, so that many researchers can share the use of one sample. Any research using tissues must be done with appropriate information about the tissues, and in a ethical manner that respects the patients' rights. The Program for Critical Technologies in Breast Oncology helps address all of these various issues, and provides one central facility where breast cancer researchers may obtain tissues and information about tissues, have access to research assays, and receive guidance on ethical issues.</p>

## **Introduction**

During the past 5 years (1994 to 1999), The Program for Critical Technologies in Breast Oncology (PCTBO) has established a core technical and tissue procurement resource that: i) maximizes access to human breast tissues and tumor DNA for basic investigators; ii) facilitates the application of molecular technologies in clinical breast oncology; and iii) makes such technologies routinely available to clinical investigators. This program was built on Yale's existing Program for Critical Technologies in Molecular Medicine and the Tissue Procurement Shared Resource of the Yale Cancer Center, and complements the Yale Tumor Registry and Yale's Rapid Case Ascertainment System. The existence of a Breast Cancer Research within the Yale Comprehensive Cancer Center has helped to increase the utilization of the PCTBO infrastructure to near maximum capacity.

## **Body**

We have organized the body of our annual report to follow the tasks delineated in the original proposal's Statement of Work: 1) collection of samples; 2) establishment of a database; 3) preparation and distribution of samples; 4) development of assays relevant to breast cancer.

We present the Tasks and the year-by-year work done toward accomplishment of each major task. At the end of each Task section, we summarize the total accomplishments over the course of the award.

***Task 1) Centralize collection of fresh, fixed, and paraffin embedded breast tissue samples from patients treated at Yale New-Haven Hospital and other hospitals in Connecticut.***

**Year 1:**

- a) Establish standardized protocols for procuring fresh, frozen, and paraffin embedded tissue samples of breast cancer cases from off-site institutions
- b) Provide off-site training on fresh tissue handling to personnel in participating institutions
- c) Expand routine tissue catchment to include at least five of Connecticut's largest hospitals, including most or all of those listed as phase I in Table 1
- d) Develop a mutual tissue sharing arrangement with Hartford Hospital (a University of Connecticut affiliate) to enhance breast cancer research at both U. Connecticut and Yale

**Year 2**

- a) Expand fresh breast tissue catchment area to include remaining phase I hospitals and some additional phase II hospitals
- b) Modify and enhance off-site tissue collection protocols to allow custom protocols designed to enhance RNA/DNA stability, and for selected institutions, the collection of viable tissue in culture medium
- c) Continue off-site training and monitoring of tissue collection personnel

**Year 3**

- a) Continue to expand tissue catchment area to any remaining phase II hospitals. Goal is to exceed 80% participation.
- b) Continue monitoring and training

**Year 4**

- a) Continue Collection activities
- b) Continue monitoring and training

**Summary of accomplishments**

***Administrative Aspects.*** During the years of the program, we submitted human subjects protocols to the various Institutional Review Boards and/or other hospital-based review systems, and received approval from all of the hospitals in Appendix 1. We had strong and ongoing interactions with all of our large, more academic Phase I hospitals. Phase II hospitals have, within our experience, proven to be a more challenging situation that we

originally anticipated, partly because of the growing influence of managed care and other factors. Three of the Phase II hospitals on our original list are no longer exist due to mergers or bankruptcy. We have two Phase II hospitals on our tissue collection schedule. However, smaller numbers of patients, increased numbers of cases for which no excess tissue is available, and limited off-site hospital staff time for "non-essential" operations combined to yield extremely small numbers of samples from our Phase II hospitals. Because of these facts, we made a final evaluation of the efficiency and cost-effectiveness for inclusion of the remaining, smaller, and much more geographically distant Phase II hospitals, and came to the conclusion that, at best, we would receive four or five samples per year from *all* remaining unenrolled hospitals. Because of such low anticipated yield in return for large amounts of time and energy in setting up and coordinating IRB approvals, training of hospital personnel, and scheduling of tissue collections on dry ice, we did not enroll the remaining hospitals.

The hospitals at which we had tissue protocols for collection are listed in Appendix 1.

*Tissue and Sample Aspects.* We developed and continued to use defined protocols to obtain fresh frozen tissue. Given the present trend in diagnosis and therapy of breast masses we took two approaches. The first was to continue with an aggressive prospective acquisition of samples of tissue that are prepared and embedded in OCT medium such that frozen sections can be cut from the samples. If extra tissue is still remaining, additional aliquots are bulk-frozen in tissue cassettes in liquid nitrogen, and also, when requests are outstanding, collected in a fresh, viable manner. The larger tumors, from which "bulk" specimens are available, can be used for nucleic acid or protein extraction after grinding the frozen tissue under liquid nitrogen in a mortar and pestle to obtain a fine frozen powder. Both the fast freezing and optimal maintenance of the samples (e.g. always transported on dry ice) have enhanced nucleic acid stability.

The second approach we took is applicable to samples such as small biopsies for which excess tissue is often not available from a gross specimen. In these cases, we can obtain extra frozen sections at the time a clinical section is done during an intra-operative consultation. Once the pathologist has concluded the consultation on a frozen specimen, an extra 10 sections are cut and stored on slides that are kept frozen at -80° C for future use. The remainder of the frozen specimen is handled as usual by the pathologist. We should note specifically that these slides are handled in the same manner as are the larger samples: no research use is made of any material before at least one week has elapsed after the final pathology report has been issued.

The success of our efforts to collect and distribute sections and slides is reflected in the fact that, over the 5 years of the Program, we were able to distribute over 5000 samples from 1850 cases, including about 2800 samples of sections and slides. Without our preparation and distribution of sections and slides, we would have had to exhaust our entire bank of frozen breast tissues and would still not have met the research demand. Summaries of breast-related tissues collected, distributed, and still available are presented in Appendices 2, 3, and 4.

***Task 2) Establish comprehensive database linked to the CTBO tissue bank & designed to support correlative multidisciplinary studies that utilize tissue samples***

Year 1:

- Establish on-line database incorporating the data items outlined in Table 2

- b) Establish computer network interfaces, protocols, and procedures to assure collection of the information outlined in Table 2
- c) Implement the collection of such information on samples collected at YNHH

**Year 2**

- a) Continue information collection as above at YNHH
- b) Expand comprehensive information catchment to include several phase I hospitals
- c) Establish remote link with at least one phase I hospital to allow on-line data acquisition

**Year 3**

- a) Continue information collection as above at YNHH and additional phase I hospitals
- b) Expand comprehensive information catchment to include additional phase I hospitals.
- c) Modify if needed information protocols with RCA of CPRU and the CT-tumor registry to facilitate off-site information collection, allowing data collection at some phase II hospitals

**Year 4**

- a) Continue information collection as above at YNHH and at phase I hospitals
- b) Expand comprehensive information catchment to include additional phase I & II hospitals.

**Summary of accomplishments**

*Yale New Haven Hospital information.*

In year 1 we established the protocols to implement the database as proposed in the original application. The data files were resident in a Macintosh PowerPC 7100 fileserver and were created using FileMaker Pro 2.0 software. With the release of FileMaker Pro version 3.0 in early 1996, we completely redesigned the database files to take advantage of the fully relational aspects of the new FileMaker version. This major re-working of the PCTBO's own database was completed in year 4. At the present time, although Army funding has ended, we are once again extensively remodeling the database to include more specific descriptors of the tissue samples themselves.

To respond to the long term need to provide ease of access to data on all databases for use by researchers, we had done work with the Yale Comprehensive Cancer Center [YCCC] and Yale New Haven Hospital. When the reorganization of the Clinical Research Office [CRO] at the YCCC was completed in late 1995, we met with Drs. Lee Schacter and Daniel Zeltermann of the CRO to define common goals and potentials for sharing information and resources between the CRO and our core facility of the PCTBO. At a meeting in January 1996, we explored the efficacy of implementing a data warehouse architecture, where one could define and regularly download applicable data from existing systems onto data warehouse running Oracle or some other database product. This would allow users running database query software at their desktops to query information from the data warehouse, reducing demand on the programming resources of existing systems, including the Pathology Information System and the Yale-New Haven Hospital Tumor Registry.

In year 4, purchase of a multitasking computer with ethernet and TCP/IP capabilities and hard disk storage has been accomplished. Software for data storage was evaluated: Oracle Clinical was brought on-site for many months before the decision was made that it would not satisfy the demands of the program. Instead, programming staff were recently hired to define, configure, maintain, and archive a custom database using Oracle, with Microsoft Access front-end. We continue to actively work with the Breast Cancer Research Program. They obtained funding to support efforts to retrieve patient demographic, treatment, and

followup data. This activity started in August 1997, and currently includes information on 218 subjects enrolled in clinical trials at YNHH. We are using this opportunity to piggyback on and expand the scope of their project to include references to the breast tissue samples available through the PCTBO.

The most recent data entry for this patient database project includes: Demographics and epidemiologic information such as known risk factors and family history; pathology and staging; treatment (surgeries, radiation including response to treatment, chemotherapy/endocrine therapy including response to treatment; and periodic (every 3 months) updates on disease status.

In addition to meeting with the CRO, we also have had ongoing interactions with Yale New Haven Hospital. The hospital, for reasons of more efficient management, state reporting requirements, and the goal of daily updates from all areas of the hospital, is working towards combining data from all of its computers. This project is making progress even with limited resources, and although it is transaction-oriented and not designed for research use, the fact that longitudinal data tracking will be more easily accomplished can in fact be made to serve research use as well. Our meetings to date have proved quite productive. We continue to actively collaborate with people from Hospital Management and Information Systems, and for the shorter term, we are discussing the possibilities of prospectively designing additional fields in the Clinical Archive database that will serve breast cancer research needs.

*Off-site hospitals.* With the continuation of tissue collection routines from phase I hospitals, we also remained successful in retrieving information about the tissue specimens. Pathology reports at a minimum are submitted for each specimen, and this information collection is coordinated and accomplished by the travelling associate, Bonnie Kaye. All hospitals from which tissue is retrieved are supplying this comprehensive information. However, after information is recorded, we "anonymize" the tissue and related information because all of our off-site IRB approvals are for use of anonymous samples only. We developed a simple and easy-to-use format that enables both collection of information about the tissue samples, and fail-safe anonymizing of the samples.

Remote data collection continues to be possible via modem access to the PCTBO FileMaker Pro database through AppleTalk Remote Access software. Appropriate security precautions have been implemented. We continue to collect Pathology Reports from sites, however, due to the limited time commitment that off-site hospital staff can make as the demands of managed care increase. The feasibility of direct downloading of data from pathology reports into the PCTBO database continues to be studied. The Pathology Department now plans to upgrade to a new Pathology Information System in the second half of 1999, and direct data transfer will probably follow shortly thereafter. In the interim, copying and pasting of relevant data is utilized, and will probably remain the basis for most of our data acquisition, since this method allows human review of appropriate information entering the database.

***Task 3) Prepare and distribute breast tissue samples from the CTBO repository to investigators***

**Year 1:**

- a) Establish standard protocols for tissue requests and distribution
- b) Establish multidisciplinary review board to establish principals for prioritizing requests for rare breast lesions
- c) Distribute fresh, frozen, fixed, and paraffin embedded breast tissue to investigators

- d) Establish methods for distributing DNA, RNA, and blots suitable for hybridization studies
- e) Inventory and review samples in paraffin archive dating back to 1915

**Year 2**

- a) Continue tissue and DNA/RNA distribution as above
- b) Continue inventory and review of paraffin archive, with indexing to CTBO database
- c) Establish on-line access via University network for selected data in CTBO tissue database
- d) Advertise availability of breast cancer tissue for research at Yale and U. Connecticut

**Year 3**

- a) Continue tissue and DNA/RNA distribution as above
- b) Continue inventory and review of paraffin archive, with indexing to CTBO database
- c) Continue to advertise as above

**Year 4**

- a) Continue tissue and DNA/RNA distribution as above
- b) Complete inventory and review of paraffin archive, and their indexing to CTBO database (Total paraffin collection > 1 million blocks)
- c) Continue to advertise as above

**Summary of Accomplishments**

*Access to the Resource.* Protocols for tissue request and distribution functioned well over the past 5 years. In cooperation with the Yale Human Investigation Committee, we designed a specific approval form to supplement the information and service request forms already in use. The new form gives all the useful information that we require in order to satisfy the HIC approval given to investigators to receive patient tissue. We continue to work closely with the Yale Human Investigation Committee to insure that all programs involving research use of samples of archival or fresh frozen human breast tissue are channeled through the PCTBO. As we expected, as information is disseminated about our bank, frozen samples are increasingly being requested.

Extraction of DNA from frozen sections and from archival paraffin tissues continues to be done in our laboratories. Extraction of standard quality RNA from thick (10-20  $\mu\text{m}$ ) frozen sections (and in some cases from paraffin blocks) can also be accomplished. Given the minimal size of the breast biopsies and the lesions contained in the tissue, collection of very high quality RNA is limited to large tumor specimens.

Over the 5 year of collection (July 1994 to June 1999), we have obtained 1803 parts from breast cases, drastically up from the 589 parts collected in year 1, and even increased over the 1016 parts collected in year 2 and 1704 in year 3. The major reason for this increase continues to be the fact that frozen section slides are collected at the time of diagnosis, and held in the bank until the case is signed out. A detailed list of cases collected is included in appendix 2.

Collections of excess breast cells from the Cytology section of the Department of Pathology was continued in collaboration with Dr. David Rimm, cytopathologist. The excess volume of fine needle aspirations (collected with a Cytec apparatus) have been stored and catalogued, and are available for research use. This new source of breast cells is proving to be of enormous value.

Distribution of breast tissues and tissue products has occurred from two different modules: tissue distribution from all fresh and frozen cases collected are summarized in the appendix 3 report "Tissue Distribution." An additional distribution of breast specimens, of approximately one-third of the 75,000 tissue sections produced by the Research Histology component of the PCTBO over the past 5 years, are from paraffin breast samples, and are not listed in this report. The large number distributed from previously banked samples only serves to emphasize the enormous power of the system of centralized collection and critical distribution of only those types and amounts of tissues actually needed by each investigator. The fact that the large majority of patient cases originally collected still have some tissue left in the bank represents a dramatic increase in numbers available for further research.

*Paraffin archives.* With our continuing work on the resource of archival paraffin specimens, the paraffin archives themselves have been substantially improved. We successfully finished the complete reorganization of over 3 million paraffin blocks, physically sorted and refiled all blocks, and consolidated the warehouse locations of the paraffin blocks from 3 separate sites to 2 closer, climate-controlled sites. These overall improvements have made a huge difference in ease of use of this most valuable resource, and is reflected in the large number of recuts requested from the blocks.

Of 900,000 cases cases available in paraffin from the pathology archives, data from the Yale Tumor Registry indicateD that 10,750 are of breast cancer, including both invasive and in situ. We identified specific computer-based pathology accession numbers these samples. We completed the process of identifying specific blocks from each case in which breast cancer is present. This labor- and time-intensive process was started with identification of ductal carcinoma in situ cases, and later moved to invasive cancer. For this, our work was much easier since the invasive tumors tend to be much larger than the in situ carcinomas we reviewed for the last report. We review pathology reports to find the designated tumor block. Reliance on the path report for tumor ("T") or primary tumor ("P" or "PT") block designations is sufficient for most of the invasive cases.

*Publicizing the Resource.* The Yale Comprehensive Cancer Center's Breast Cancer Research Program meets on a monthly basis for presentation of research seminars and ongoing communication among all breast cancer researchers at Yale School of Medicine, Yale University, and Yale-New Haven Hospital. At these monthly gatherings we present information about the currently available breast tissue (frozen and paraffin-embedded), as well as general information about the ability to set up prospective collection protocols and our interface with the Yale Tumor Registry for identification of breast cancer cases. Through the PCT Web page (<http://info.med.yale.edu/pathol/crittech/ct.htm>) we have received inquiries from researchers about our resource, and have entered into several agreements with a researchers in other cities and states to provide samples our breast cases. All appropriate administrative requirements, including IRB approvals and a Material Transfer Agreement are completed for these interactions. We expect ongoing inquiries about our resource. Because of the tissue we have available (see appendix 5)—847 cases, and almost 5500 samples—and because we provide usually provide portions of the samples rather than whole tissues, we expect to be able to supply most of the breast cancer researchers who approach us

***Task 4) Develop and offer on a minimal fee-for-service basis routine molecular and histologic tissue analyses of relevance to breast cancer. Of particular interest are assays that can be carried out on minimal tissue samples.***

**Year 1:**

- a) Implement FASAY assay for p53 function in breast cancers
- b) Establish protocols for the quantitative analysis of prad, ras, and neu
- c) Establish protocols for mini and microsatellite repeat variability
- d) Establish routine research histochemistry and immunohistology service for breast tissue

**Year 2**

- a) Establish procedures for the routine performance and reporting of above assays
- b) Establish protocols for analysis of at least three additional genes as noted in Table 1

**Year 3**

- a) Continue to offer routine analyses as above
- b) Establish protocols for analysis of at least three additional genes as noted in Table 1
- c) Advertise these services to breast cancer investigators at Yale and the University of Connecticut

**Year 4**

- a) Continue to offer routine analyses as above
- b) Establish protocols for analysis of at least three additional genes as noted in Table 1 or for other candidate genes as they become recognized
- c) Continue to advertise as above

#### Summary of Accomplishments

***Immunohistochemistry and other assays.*** The detailed methods developed in year 1 and reported in our annual report of July 1995 have been standardized for routine performance upon request of investigators. These include a functional assay for p53, PCR analysis of PRAD-1 (Cyclin D1), assay for NEU oncogene function, Somewhat surprisingly, researchers most often request immunostains for various oncogenes and tumor suppressors, including p53, neu, alpha-catenin, E-cadherin, and bcl-1/prad-1, rather than PCR-based assays. We have worked extensively on further refinement of immunostaining protocols, including specific work to adapt and optimize use of commercially-available antibodies on paraffin-embedded tissues. Often these antibodies have not been tested on paraffin sections, and we have been successful in a number of cases. Two protocols were very effective: the use of recent antigen-retrieval method of pressure-cooking, and use of a commercially available "one-step" method of staining (Dako EnVision system, antibody and HRP coupled to an inert polymer backbone; or "universal" secondary with poly-HRP). Both of these techniques can be applied to any immunohistochemical staining protocol. Pressure-cooking can also be utilized in immunoblots.

As noted above, because most investigators are interested in immunohistochemistry-based assays for changes in oncogenes and/or tumor suppressor genes, we continued to concentrate on this type of molecular analysis. We currently have protocols for use of either commercially-available or lab-made antibodies for a wide range of proteins implicated in breast cancer, including p53, neu/erbB2 including one specific for the biologically active phosphorylated form of the protein), estrogen receptor, progesterone receptor, alpha-

catenin, E-cadherin, and DCC. We have critically examined antibodies newly available for p53, neu/erbB2, c-met, and various angiogenic factors including VEGF and FGF. We analyzed and compared commercially available antibodies for use on paraffin sections.

We tried different antibodies, and several antigen retrieval methods including a microwaving based protocol (using a number of different incubation solutions) and a pressure cooking protocol (using a citrate solution). We found the pressure cooking protocol to enhance the staining intensity without causing previously negatively characterized specimens to appear positive. Unlike the Ab-1 which we had been using for neu/erbB2, the antibody cb-11 does not require pressure cooking pretreatment, and we have simplified our protocol for that antigen.

*Publicizing the resource.* Although at first it might seem that “routine” immunostains for breast tissues would not cause much response among investigators, the opposite is in fact true. We have advertised our immunostaining services, and many researchers have expressed interest in the newly developed and optimized ER, PR, p53 and neu/erbB2 stains for their breast tissues. As noted above, are constantly identifying and evaluating new antibodies and staining protocols so that we may offer state-of-the-art immunohistochemistry to breast cancer researchers.

## **Key Research Accomplishments**

### Maximize the quality and quantity of breast cancer samples

- timely collection with standardized protocols from multiple hospitals in Connecticut
- pathologists involvement in sample selection
- coincident collection of matched normal breast tissue for same patient
- development of a frozen tissue bank containing over 800 patient cases and over 5000 individual samples
- establishment of a robust database on banked breast tissue collection
- enhance the application of basic science advances to clinical breast oncology providing as a routine service sophisticated immunochemical and DNA analyses of tissue samples

### Maximize research use of breast samples

- centralized distribution point
- standard distribution procedures
- wide area notification of tissue availability and order processing
- help investigators understand and procure Institutional Review Board approval for protocols involving human breast tissue

## **Reportable Outcomes**

### *Publications*

The Program for Critical Technologies in Breast Oncology is a facility that exists to support the research efforts of many other scientists and clinicians. To that end, reportable outcomes that reflect the success of the Program include measures of use of the resource. During the past 5 years, over 40 research laboratories have received tissue-derived samples from the Program, and a partial list (27 publications) of major articles that have been a direct or indirect result of such access to our collection of human breast cancer samples is shown in the References section.

In addition, a publication relating to consent for research use of excess tissue was edited by Christine L. Howe, Ph.D., Deputy Director of the Program for Critical Technologies in Molecular Medicine, of which the PCTBO is a component.

Howe, CL (co-chair and editor), 1997. "Model Consent Forms & Related Information on Tissue Banking from Routine Biopsies," Public Responsibility in Medicine and Research [PRIM&R] and Applied Research Ethics National Association [ARENA] publication.

### *Invited lectures and workshops:*

Experiences associated with the overall scientific, administrative, and ethical aspects of a large tissue procurement and banking facility have been presented in many contexts by Christine L. Howe, Ph.D. As noted above, Dr. Howe is Deputy Director of the Program for Critical Technologies in Molecular Medicine, of which the PCTBO is a component.

“Tissue Banks and Registries,” co-moderator of workshop for Applied Research Ethics National Association (ARENA) conference “IRBs; Motivating for Change, San Diego CA, November 10, 1998.

#### *Patents*

As a result of the much increased collection and use of breast cancer-related tissues, the physical inventory of frozen tissue needed to be made much more easily accessible to technical staff. The ease of filing and retrieving samples had a direct influence on the ability to provide timely service to investigators requesting samples from the bank. A special freezer rack was designed by Christine L. Howe, Ph.D., and she is currently interacting with the Yale Office for Cooperative Research to determine the feasibility of obtaining a patent on this rack.

#### *Tissue Repository*

One of the major efforts of the Program for Critical Technologies in Breast Oncology was development of a human tissue resource to include frozen and paraffin-embedded samples. Over the past 5 years, this resource has dealt with over 2000 patient cases, and has handled almost 10,000 individual samples from these cases, including fresh tissue for tissue culture, several types of frozen tissue, prepared slides, and research-use paraffin blocks. The frozen bank currently contains over 800 patient cases, and over 5000 samples. See Appendices 2, 3, and 4 for lists of collection and use of these samples.

#### *Informatics*

Another major effort of the Program for Critical Technologies in Breast Oncology was development of a database to accompany the human tissue samples. We have continued to refine the database such that it not only accurately lists the inventory of the frozen and research paraffin tissue samples, but also tracks investigator use of the resource, allows for fee-for-service charges to be recovered, maintains detailed information about investigators’ Institutional Review Board protocol status and approval for various levels of access to patient information, and contains information about each sample such as pathologic diagnosis, % tumor cells in the sample, etc.

## **Conclusions**

Overall, the Program for Critical Technologies in Breast Oncology has been enthusiastically received by the research community. In the future, we hope to carry on toward the goals of the PCTBO. However, obtaining funding for this core facility continues to require innovative approaches, and recently includes negotiations with biotechnology and pharmaceutical companies for access to services to supply them with tissue and tissue-related information. There are large ongoing expenses associated with maintainence of the existing tissue collection and database, not to mention costs for continued sample collection. We hope to continue to support the absolutely essential services required for research access to human tissue samples with adequate funding resources needed to maintain the Program.

The years of support provided by the Department of Defense for the Program for Critical Technologies in Breast Oncology have seen many encouraging developments for this important core facility. We have increased the numbers of off-site hospitals involved in the Program. We finished conversion of a database uniquely suited to our collection, assay, and distribution of tissue products along with anonymous information describing the tissue samples. We collaborated with the Breast Cancer Research Program to obtain patient information for the tissue samples we hold. We continue to work intensely and collaboratively with many different parts of the Hospital, Medical School, University, and Cancer Center to streamline efficient data collection and access. Our numbers of collected breast tissue include over 2000 patient cases and almost 10,000 individual frozen samples. We have distributed more than 5,000 fresh and frozen tissue products and more than 20,000 paraffin sections since the start of the Program.

We continue to collect and distributing breast cytology specimens, a tissue source not widely available. We have completely reorganized more than 3 million paraffin blocks so that easy, efficient access is a rule rather than an exception, and have identified all computerized breast cases with malignancies for which blocks are available. We have expanded the research community's knowledge of and requests to the PCTBO for breast tissue products and related clinical information about the samples. We continue to develop translational research, moving research assays closer to clinical utility.
